CHAPTER 1: INTRODUCTION

1.1. Research background

Over the past several decades, environmental degradation and unsustainable consumption have become among the most critical global challenges. While numerous initiatives have focused on advancing cleaner production technologies, such efforts remain insufficient to comprehensively mitigate the adverse impacts originating from consumers' choices, behavioral patterns, and disposal practices. The widespread dominance of materialistic values and mass-consumption culture has exacerbated environmental consequences, including pollution, depletion of natural resources, and climate change (Kang, Martinez, & Johnson, 2021). The generation of municipal solid waste is expected to increase from 2.1 billion tonnes in 2023 to 3.8 billion tonnes by 2050. In Vietnam, according to the Ministry of Natural Resources and Environment's 2025 Report, Vietnam generates over 23 million tons of household waste annually, along with over 7 million tons of industrial solid waste and over 630,000 tons of hazardous waste. Therefore, the study of factors driving "sustainable consumption" has attracted significant interest from many researchers worldwide (UNEP, 2024).

Specifically, the fashion, clothing, and textile industries have been widely identified as major contributors to environmental degradation (Rume & Islam, 2020), making them responsible for ecological and social issues such as climate change, natural resource scarcity, and chemical abuse (Ertekin & Atik, 2020). There are many research findings that point to the environmental impacts of this fast fashion industry, such as water pollution (Abbas, Chiang Hsieh, Techato, & Taweekun, 2020); greenhouse gas emissions from fossil fuel processing and the use of toxic chemicals (Khurana & Ricchetti, 2016). Therefore, there are growing concerns about the social impacts of the fast fashion industry, as fast fashion market revenue reached a high of \$30.58 billion in 2023, while revenue from the sustainable fashion market was only \$8.25 billion. (Trueman

& Management, 2022). According to Eco - Stylist's (2022) research, in the world of fast fashion consumers, people buy over 60% more clothes than they did 20 years ago, and the consumption time is less than a year, meaning over 50% of clothes end up in landfills. Similarly in Vietnam, according to ECBD 2023, the fast fashion market shows strong growth figures, with a capacity of approximately 4 billion USD in 2023 and is projected to reach 6.5 billion USD by 2028, with an annual compound growth rate (CAGR) of about 10% from 2024-2028. This development is driven by rising incomes, a growing middle class, and changing consumer trends. Consumer demand is the main reason for the rapid growth of the fast fashion market. Therefore, this unsustainable consumption poses the greatest challenge for governments in promoting a green economy and achieving one of the sustainable development goals, which is sustainable consumption practices.

Sustainable consumption has emerged as an urgent requirement to address environmental issues, advocating for consumption models that minimize ecological impact while meeting current and future needs (United Nations, 2024). Sustainable consumption has become one of the most important aspects, with increasing interest from many consumers.

Sustainable consumption has emerged as an urgent imperative for addressing environmental challenges, promoting models of consumption that minimize ecological impact while fulfilling both present and future needs (United Nations, 2024). It has become one of the most critical dimensions of modern consumer behavior, attracting growing attention from individuals and institutions alike. Recent global statistics further illustrate this shift. Based on a survey conducted in 2023 by IBM and the National Retail Federation, almost 70% of global consumers reported that they are willing to pay a premium for products that are environmentally responsible or ethically produced. In recent years, the demand for sustainable consumption in Vietnam has seen a significant increase. Consumers are increasingly choosing to use green, environmentally friendly

consumer products. As reported by the Ministry of Industry and Trade, the demand for green products in Vietnam increased by an average of 15% annually from 2021 to 2023. More than 72% of Vietnamese consumers express a willingness to spend extra on green products, reflecting a rising awareness and concern for environmental issues. Sustainable consumption is not just a trend, but also a key factor in helping businesses achieve sustainable development and enhance their competitiveness. (Haller, Wallace, Cheung, & Gupta, 2022).

In recent years, global consumerism has witnessed strong growth due to internationalization, rising living standards, and exposure to diverse cultures, leading to a more experience-based economy (Pangarkar, Shukla, & Taylor, 2021). A unique aspect of this experience economy involves a novel social movement called minimalism. Minimalism is being promoted as a new form of consumption compatible with environmental sustainability, economic practices, technological progress, and psychological well-being. This ideology has universal appeal for both social and individual needs, making it a compelling alternative to traditional consumer behavior. Increased awareness of environmental concerns like climate change and resource scarcity has prompted many individuals to reconsider their purchasing behaviors. Embracing minimalism aligns with a sustainable and eco-friendly way of living (Vollebregt, Mugge, Thürridl, & van Dolen, 2023). Minimalism, a consumer trend, has gained popularity, representing a deliberate lifestyle philosophy characterized by actively reducing possessions and prioritizing simplicity (Wilson, & Bellezza, 2024). Minimalism emphasized owning less, reducing excessive consumption, and enhancing one's quality of life by curbing spending (Pangarkar, Shukla, & Taylor, 2021). For this reason, there is a global trend toward pursuing a strong lifestyle. According to a YouGov survey of 8,148 Americans, 26% of Americans identify as living a minimalist lifestyle (YouGov, 2025). In Vietnam, according to a survey by Tuoi Tre newspaper (2023), 47% of young Vietnamese people (aged 18-35) expressed interest in sustainable lifestyles, with minimalism playing a significant role. They see this not only as a way to reduce financial pressure but also as

a means to protect the environment and improve their quality of life. The rise of this trend in Vietnam is a notable social phenomenon, reflecting a shift in the value system of a new generation.

However, as of now, these studies still have certain gaps. One of the biggest debates is the "awareness-action gap". Many studies show that despite consumers becoming increasingly aware of environmental issues, the actual rate of sustainable consumption practices remains very low. In Vietnam, a survey by the Association of High-Quality Vietnamese Enterprises (2024) shows that only about 12-18% of consumers in major cities truly pursue this lifestyle. The conflict between "knowing" and "doing" is a major question whose answer is still widely debated. Therefore, the authors continued to explore ways of life or factors that could transform awareness into concrete action, and "minimalism" emerged as a promising new approach.

Thus, minimalism is a phenomenon that is thriving and rapidly developing in the market and in society. Researching the nature of minimalism, its components, the factors that influence it (simple aesthetics, greenwashing perception, perception of sustainable labels, price perception, and environmental concern), and how it can serve as a bridge to promote sustainable consumption is necessary. The research results are not only scientifically significant but also have important implications for corporate management practices and policy planning, aiming to develop effective strategies to encourage a more sustainable living and consuming community.

1.2. Research Objectives

1.2.1. Overall Objective

Sustainable consumption trends and minimalist lifestyles are gaining increasing attention in the fashion industry. However, the role of minimalism in promoting sustainable fashion consumption intentions still needs to be explored. The study not only sheds light on the mechanism by which minimalism influences and shifts from material consumption to prioritizing sustainable values, but also promotes the intention to choose

environmentally friendly fashion. Through this, the study not only contributes to clarifying the role of minimalism as a driver of sustainable consumption but also provides practical insights to help businesses and policymakers develop more suitable strategies such as developing circular supply chains, designing recycled products, or enhancing corporate social responsibility communication, with the aim of forming a more responsible and sustainable fashion ecosystem.

1.2.2. Specific Objectives

The role of minimalism is increasingly significant in people's current fashion consumption intentions, especially in connection with the trend of sustainable consumption. Based on this foundation, the present study was carried out with the aim of achieving specific research objectives. Determine the factors influencing Minimalism and Sustainable Fashion Consumption Intention Assessment of the impact of each factor on Minimalism, as well as the direct impact of certain factors on sustainable fashion consumption intentions. Clarifying the mediating role of Minimalism in the relationship between factors and sustainable fashion consumption intentions. Suggest management implications to help businesses orient their strategies to raise awareness of minimalism and promote sustainable fashion consumption intentions in Ho Chi Minh City.

1.3. Research Questions

Based on the issues identified above, the research team proposes the following research questions:

1. What factors impact Minimalism and the Intention for Sustainable Fashion Consumption?
2. How is the level of influence of each of the above factors on Minimalism and the Intention for Sustainable Fashion Consumption demonstrated?
3. How does Minimalism act as a mediator in the relationship between the influencing factors and the Intention for Sustainable Fashion Consumption?

4. What solutions are needed to enhance awareness of minimalism and promote the intention for sustainable fashion consumption in Ho Chi Minh City?

1.4. Subject and scope of research

Research Object: To study the impact of factors affecting minimalism on the intention for sustainable fashion consumption.

Survey Subjects: The survey subjects are consumers of all ages in Ho Chi Minh City who are aware of or have heard about the minimalist lifestyle.

Scope of Research:

Spatial Scope: The research is conducted in Ho Chi Minh City.

Temporal Scope: The survey and data collection will be carried out from September 25, 2025, to October 9, 2025.

1.5. Research Methodology

The study primarily uses two main methods: qualitative and quantitative research.

Qualitative Research Method: This is conducted by collecting opinions and viewpoints from consumers in Ho Chi Minh City to supplement and adjust the observational variables, thereby refining the measurement scales and survey questionnaire for the main research phase.

Quantitative Research Method: This is the primary method, conducted through an online survey using a detailed questionnaire. The quantitative research will be carried out via online surveys using Google Forms, targeting consumers in Ho Chi Minh City through random probability sampling. A 5-point Likert scale will be used to measure variables such as attitudes toward minimalism, sustainable consumption behavior, and the influence of this lifestyle on sustainable consumption intentions. The collected data will be processed using SmartPLS 4.0 software. Analytical techniques will test reliability

using a Structural Equation Model (SEM). Hypothesis testing will be performed using the Bootstrapping method, with evaluation metrics such as p-value, R^2 , and f^2 . Through these analytical results, the study will draw scientific conclusions about the relationships within the model.

1.6. Thesis Structure

Chapter 1: Introduction. This chapter presents the rationale, general objectives, specific objectives, research subjects, research scope, research methodology, significance, and the overall structure of the research.

Chapter 2: Theoretical Framework. This chapter presents the theoretical foundation, including key concepts, foundational theories, and a review of domestic and international studies. Based on this, it proposes the research model and hypotheses.

Chapter 3: Research Methodology. This chapter outlines the research process, scale design, questionnaire design, scale development, survey sample collection, and provides a detailed description of each quantitative research method used.

Chapter 4: Research Results. This chapter covers data processing, analysis of the results based on the chosen research methods, and presents the findings.

Chapter 5: Conclusion And Implications. This chapter provides conclusions, discusses managerial implications, identifies the limitations of the study, and finally, suggests directions for future research.

CHAPTER 2: THEORETICAL FRAMEWORK

2.1. Fundamental theories

2.1.1. Theory of Planned Behavior (TPB)

The Theory of Planned Behavior (TPB) was introduced by Ajzen (1991) as an expansion of the Theory of Reasoned Action (TRA). The major difference between TPB and TRA is the variable addition of “perceived behavioral control” to simplify behaviors that are not completely under the control of the individual. The introduction of TPB marked a significant step forward in the study of human behavior, as it broadened the scope of explanation and prediction to more complex domains, ranging from health and education to the environment and consumption (Ajzen, 1991).

The core of TPB is the idea of behavioral intention. It is considered the most immediate and powerful predictor of current actions. Behavioral intention indicates a

person's desire to engage in a particular behavior; the stronger the intention, the higher the likelihood that the behavior will occur. Ajzen (1991) suggests that the intention to behave is shaped by three key determinants: attitude toward the behavior, which reflects a person's positive or negative evaluation of the behavior; subjective norms, which gather observed expectations to participate or refrain from participating in the behavior; and perceived behavioral control, which represents a person's confidence in their ability to execute and control the behavior.

Ajzen emphasizes the impact of subjective norms on behavioral intention, noting that they reflect the "perceived social pressure to perform or not to perform the behavior". Finally, perceived behavioral control represents a person's perception of their capability to engage in a specific behavior. It encompasses both their self-confidence in performing the behavior and their perception of potential barriers or facilitating factors that may influence its execution. Ajzen highlights that perceived behavioral control shapes behavioral intention and indirectly influences behavior (Ajzen, 2002). He argues that individuals tend to form intentions and engage in behaviors when they feel certain about their ability to control the situation. Ajzen further stresses the distinction between perceived behavioral control and actual behavioral control, asserting that both aspects influence behavioral prediction (Ajzen, 2002). While perceived control affects intention, actual control can directly influence behavior, underscoring the need to consider both aspects when evaluating behavioral outcomes.

In the study of minimalism, TPB can be applied to explain how psychosocial factors influence the intention and practice of this lifestyle. An individual will have a stronger intention to live a minimalist life when they hold a positive attitude toward reducing possessions and engaging in selective consumption, when they perceive social support through subjective norms, and when they think they possess sufficient capability to control their shopping habits and product choices. Thus, TPB not only helps to explain the formation of intention and sustainable consumption behavior but also highlights the

mediating role of minimalism in connecting personal and social factors with responsible consumption outcomes.

Figure 1. Theory of Planned Behavior TPB

2.1.2. Stimulus-Organism-Response (SOR) Theory

This study applies the Stimulus-Organism-Response (SOR) theory, which originates from environmental psychology, to analyze sustainable fashion consumption intention, where Minimalism plays a crucial role in Ho Chi Minh City. SOR theory explores complex relationships, establishing a clear logical chain to achieve the research objectives: identifying factors that affect Minimalism and Sustainable Fashion Consumption Intention, assessing the impact level of each factor, clarifying the mediating role of Minimalism, and proposing managerial implications for businesses. With its flexibility unconstrained by a fixed structure, SOR allows for adaptation to research variables (Yadav & Kar, 2024), linking values, perceptions, and emotions to consumer behavior.

Mehrabian and Russell's (1974) SOR theoretical framework states that environmental stimuli (Stimulus - S) affect the internal state of an individual, known as the organism (Organism - O), leading to a behavioral response (Response - R). In this study, the stimuli are identified as external environmental cues that influence fashion consumption behavior, including: Simple Aesthetics, Greenwashing Perception, Price Perception, and Sustainable Label Awareness. These factors represent signals from products and the market, playing an important role in shaping the awareness and attitudes of consumers in Ho Chi Minh City, where the trend of sustainable consumption is growing strongly.

The organism state is considered a psychological transformation mechanism where stimuli are converted into cognitive and emotional responses. In this study, Minimalism is chosen as the main mediating variable in the organism state, reflecting an attitude or lifestyle formed by stimuli such as Simple Aesthetics, Greenwashing Perception, and Sustainable Label Awareness. Additionally, Environmental Concern is regarded as a supporting element in the internal state, reinforcing the awareness of sustainable values and environmental responsibility, through that contributing to shaping the consumer attitudes of the urban population. The mediating role of Minimalism is emphasized as a crucial bridge, transforming environmental impacts into sustainable behavioral intentions.

The response in the model is the Intention to Consume Sustainable Fashion, representing a consumer's conscious commitment to environmentally friendly fashion consumption behaviors. This intention is not only directly influenced by certain stimuli (such as Sustainable Label Awareness and Environmental Concern) but is also shaped through the mediating role of Minimalism. This finding provides a basis for the proposed managerial implications, which are based on enhancing awareness of Minimalism and related factors, thereby helping businesses build strategies to promote sustainable consumption in Ho Chi Minh City.

The SOR theory has proven effective in green consumer behavior research, with diverse applications across num, such as social networking services, where information avoidance is seen as a response (Kumalasari & Priharsari, 2023), as well as fashion related social e-commerce, where ongoing purchase intention is examined as a reaction (Hewei & Youngsook, 2022). The study by Yadav and Kar (2024) also successfully applied SOR to analyze the impact of religious values and Minimalism on the intention to repurchase sustainable fashion, thereby affirming the applicability of SOR in the context of this study, especially when integrated with TPB to clarify detailed behavioral mechanisms.

2.1.3. Perceived Value Theory (PVT)

Zeithaml (1988) introduced Perceived Value Theory (PVT) to explain how consumers evaluate and make purchasing decisions predicated on a comparison between perceived benefits and perceived sacrifices. Accordingly, “perceived value” is understood as the consumer's overall evaluation of a good or service, based on their perception of what they receive versus what they must give up. Unlike objective value, perceived value is subjective, formed from individual perceptions, expectations, and experiences (Zeithaml, 1988).

Subsequent research has expanded this concept in a multidimensional direction. The PERVAL scale was developed by Sweeney and Soutar (2001), identifying four main components of perceived value: (1) functional value - related to product quality and performance; (2) emotional value - the positive feelings experienced; (3) social value - the social image or status associated with the product; and (4) conditional value that depends on a specific consumption context. This model helps to understand more deeply how consumers evaluate the overall product experience, not just based on price or functionality (Sweeney & Soutar, 2001).

In the context of modern consumption, especially sustainable consumption and minimalist lifestyles, PVT becomes a useful theoretical framework for analyzing how consumers redefine value beyond material benefits. The perception of price not only

reflects affordability but also an assessment of fairness, reasonableness, and the meaning of consumption. For those pursuing minimalism, perceived value is formed based on simplicity, utility, and spiritual value rather than quantity or ostentatious value. Therefore, PVT provides an important foundation for explaining the relationship between price perception and the tendency toward minimalism, through the mechanism of balancing perceived benefits and perceived sacrifices in consumer behavior.

2.1.4. Psychological Reactance Theory (PRT)

Jack W. Brehm (1966) proposed Psychological Reactance Theory (PRT), posits that when people feel that their freedom of choice is being challenged or limited, they experience a state of motivation of psychological reaction to regain that independence. This state can manifest as feelings of discomfort, refusal to comply, or engaging in behavior contrary to the external message or pressure (Brehm, 1966).

Recent studies show that psychological reactance can affect behavioral intentions and the decision-making process of consumers. When the perception of being controlled increases, consumers tend to reduce their trust in marketing messages, thereby weakening the effectiveness of communication strategies. Conversely, when messages emphasize choice and autonomy, reactance decreases, leading to higher acceptance.

In the context of consumer behavior, psychological reactance often occurs when consumers feel coerced, manipulated, or lacking sufficient decision-making power. For example, high-pressure marketing strategies such as scarcity messages ("today only"), binding advertisements, or limited choices can trigger psychological reactance, leading consumers to refuse to buy or seek alternatives to assert their freedom (Brehm & Brehm, 1981). One increasingly common factor causing psychological reactance in consumer behavior is greenwashing, the phenomenon where businesses make false or exaggerated sustainability claims to create a "green" image to attract customers. When consumers perceive this deception, they feel their freedom of choice is being manipulated. A significant consequence of this reactance state is a shift towards more independent and

autonomous consumption models. Consumers tend to reduce trend-based consumption, limit their reliance on marketing messages, and focus on making fewer but more meaningful choices to avoid being led by greenwashing strategies. In other words, a high awareness of greenwashing can trigger psychological reactance, thereby increasing the tendency toward minimalist consumption as a way to restore behavioral control and protect one's autonomy.

2.2. Definition of Concepts

2.2.1. Minimalism

According to the philosophy of “less is more”, the 1960s saw the rise of minimalism as a visual art movement., reflecting both a cultural movement away from excess and toward simplicity. This concept gradually gained popularity in the consumer domain, especially as the negative impacts of materialism on personal well-being, society, and the environment became increasingly apparent (Wilson & Bellezza, 2021). Minimalism refers to the elimination of excess from one's life by concentrating on what is most important, cutting back on unnecessary spending, and enhancing life quality by abstaining from materialism (Shafqat, Ishaq, & Ahmed, 2023). According to Kang, Martinez, and Johnson (2021), the origins of minimalism can be traced to mass consumer societies, and it has recently attracted significant interest from researchers globally as it provides a basis for examining anti-consumption motives and encourages the careful consideration of a few material possessions as a source of a fulfilling and satisfying life.

Based on Naman Sreen, Mehrotra, Rsha Alghafes, and Agarwal (2024) studied minimalism as a system of values that affects ethical consumption behavior. Minimalists often live uncluttered lives, keeping only a few truly essential items and always thinking carefully before purchasing anything new (Kang, Martinez, & Johnson, 2021). In this paper, we define minimalism as a lifestyle focused on reducing material possessions and unnecessary consumption, retaining only what is truly valuable.

2.2.2. Sustainable Fashion Consumption Intention

Based on extensive academic discussions on the topic, the notion of sustainable consumption has been shaped by major international conferences. The definition from the Oslo Symposium on Sustainable Consumption (1998) states that in order to protect the needs of future generations, it is utilizing services and associated goods to meet basic necessities and enhance quality of life and improve quality of life while reducing the use of toxic materials and natural resources in addition to waste and pollution emissions throughout the life cycle of the service or product. Similarly, the Rio Earth Summit (1992) highlighted the need for a new definition of prosperity, with the goal of raising living standards by reducing reliance on the planet's limited resources and promoting sustainable lifestyles. In this study, the research team adopts the definition from the Oslo Symposium (1998) as the central theoretical foundation.

2.2.3. Greenwashing Perception

Greenwashing is the act of companies intentionally deceiving or defrauding customers with false claims about their environmental actions and impacts to build a public reputation or shape a positive image among consumers (Zhang, Li, Cao, & Huang, 2018). According to Adamkiewicz, Kochanska, Adamkiewicz, and Łukasik (2022), greenwashing is based on highlighting a single positive activity or a small part of their operations while concealing all other activities that have a negative environmental impact, with the aim of presenting themselves as more sustainable than they actually are. In the fashion industry, greenwashing is observed through sustainability claims where environmental improvements are, in fact, limited to a very small portion of collections. Furthermore, heavily promoting take-back programs is another tactic, as these programs often encourage consumers to shop without guilt rather than addressing the core problem of overproduction.

According to Font, Andreu, Mattila, and Aldas-Manzano (2025), customers' opinions of greenwashing vary over time depending on their expectations and level of

understanding, and there is a thin line between what is and is not greenwashing. The perception of greenwashing refers to consumers' awareness that businesses promote environmental-related communications without corresponding practical actions; when this perception is clear, consumers will not purchase from that company (Nyilasy, Gangadharbatla, & Paladino, 2014). In this study, we define Greenwashing Perception in the context of the fashion industry as consumers' awareness of fashion brands intentionally deceiving or misrepresenting their sustainability efforts.

2.2.4. Sustainable Label Awareness

In the context of growing concern for environmental issues and responsible consumption, sustainability labels have become an important communication tool to guide consumer behavior. This concept refers to information, symbols, logos, or visual signals printed or attached directly to packaging and products, with the purpose of providing consumers with information about the product's sustainable attributes, including environmental, social, and ethical aspects (Majer, Henscher, Reuber, Fischer-Kreer, & Fischer, 2022). Unlike traditional advertising, sustainability labels focus on enhancing product transparency, helping consumers easily identify and distinguish environmentally friendly products in a market filled with hard-to-verify marketing claims. In the fashion industry, these labels often include information about material origins, emissions, labor conditions, recyclability, and product life cycle.

Recent studies have expanded this concept to include digital labels such as QR codes and electronic traceability systems. These are seen as solutions to enhance transparency, reliability, and the verifiability of sustainability information throughout the value chain (Yadav & Kar, 2024). This is particularly important in the fashion industry, where greenwashing is a prominent issue, because high transparency strengthens trust and increases the likelihood of converting intention into actual purchasing behavior, communicating commitments and sustainable practices such as environmental, social,

ethical, product life cycle, thereby enhancing consumer confidence and promoting responsible consumption.

Besides content, the way information is presented on the label is also a critical factor affecting consumer reception and trust. Williams, Hodges, and Watchravesringkan (2023) emphasize that label design must consider the consumer's perspective, including comprehensibility, visual appeal, and the ability to compare information to maximize communication effectiveness. Furthermore, according to Yadav and Kar (2025), sustainability labels are not just a source of information but also a psychological trigger that helps reinforce personal beliefs and values (such as minimalism), thereby promoting sustainable consumption intentions and behaviors.

2.3. Literature Review

This table summarizes 11 representative research studies related to the factors influencing minimalist lifestyles and sustainable fashion consumption trends. Each study is described based on the following criteria: (1) Article Title, (2) Author(s), (3) Journal of Publication, (4) Independent Variables (denoted X1-X8), (5) Dependent Variable (denoted Y), (6) Mediating Variables (denoted Z1-Z3), (7) Research Type, and (8) Summary of Research Findings. All selected articles are reputable international scientific publications, published in Q1 or Q2 journals according to the Scimago research quality classification, ensuring high academic reliability. In the research findings section (8), the team has clearly presented the relationships between the variables in the model, indicated by a “+” sign (for a positive relationship) or a “-” sign (for a negative relationship). Additionally, the research hypotheses are evaluated based on p-values or critical values: if less than 0.05, the relationship is considered statistically significant and is accepted; otherwise, it is rejected.
